Before we publish, who owns this denominator?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Analytics is receiving requests that use the same business term for different populations, dates and customer relationships. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Could the answer be that snapshot timing creates the difference? Or are we actually seeing that the teams need different metrics? I also do not want us to miss the possibility that an undocumented exclusion is changing the denominator.

We looked at a version of this before. For the December 2019 review, please show what changed and whether the earlier conclusion still holds. The practical decision is the governed definition, owner, exclusions and reconciliation bridge. Please send a working Excel file with the exception population and clear columns; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context. A technically consistent definition still needs business ownership and approval.

Regards
