Audit wants the lineage, not another dashboard

Hi team,

Management reports are expanding faster than the evidence showing how each number was sourced, transformed and approved.

We looked at a version of this before. For the December 2019 review, please show what changed and whether the earlier conclusion still holds. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Can you test these explanations rather than choosing one at the start?

- manual exclusions are changing the answer
- the number can be reperformed from source
- different teams use the same label for different populations

The decision is which data controls must be formalised before the next assurance review. Please give us a model-ready table, data dictionary and an honest baseline.

You should be able to build the evidence from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; customer contacts, complaints and suggestions. Do not create a full enterprise lineage claim; reperform a defined metric and document every limitation.

Thanks
