Card replacement may be solving one problem and creating another

Team,

Before this becomes another standing report, can we answer the real question?

Card Operations needs to know whether replacement cards become usable quickly and whether old-card attempts continue after reissue. The possible stories are that customers resume normal use quickly, that old credentials continue to generate declines, or that ATM and transaction channels reflect card history differently.

We looked at a version of this before. For the December 2019 review, please show what changed and whether the earlier conclusion still holds. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

Please prepare a short decision pack with no more than five slides and an attached evidence table. The output must help us decide which reissue controls or customer messages need improvement.

Data available: monthly account snapshots, status events, limits, product enrolments and signatories; ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions.

Please state the limitation plainly: Card numbers are historical lists in the account snapshot; use issue and expiry dates to determine the active card.

Thanks
