Channel adoption after first successful use

Hi,

This came up in a working session and nobody had the same definition.

Product needs to define successful channel adoption as sustained useful activity rather than enrolment or one event.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: adoption differs by product and customer need; first successful use predicts continued use; or customers return to assisted channels after failure.

Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. Different teams have produced different answers from the same period, so population and timing rules need to be visible. We looked at a version of this before. For the January 2020 review, please show what changed and whether the earlier conclusion still holds.

What we need to decide is which onboarding journey and success metric should change. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency. Available data supports channel behaviour but not every app screen, click or abandoned session.

Thank you
