Monthly snapshots are leaking later knowledge

Hi,

This came up in a working session and nobody had the same definition.

Repeated monthly parquet snapshots contain fields that may be updated retrospectively, creating risk for trend analysis and models.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: closure or status fields are backfilled; records preserve true as-at state; or CDC fragments and snapshots are being combined incorrectly.

Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases. We looked at a version of this before. For the January 2020 review, please show what changed and whether the earlier conclusion still holds.

What we need to decide is which fields need event tables, effective dating or restricted use. Please bring a Power BI page with drill-through to a reproducible case list, including a few cases we can trace from source to conclusion.

The available evidence is monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. Do not assume a file path date is the effective date of every field.

Thank you
