Complaint closure quality and repeat harm

Hi,

This came up in a working session and nobody had the same definition.

Complaint status alone may overstate resolution when the same customer returns, the transaction remains unresolved or the account closes.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: resolved complaints do not recur; resolution notes are generic; or specific categories lead to repeat contact or attrition.

Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. We looked at a version of this before. For the February 2020 review, please show what changed and whether the earlier conclusion still holds.

What we need to decide is which complaint outcomes need quality review and which root causes need fixing. Please bring a working Excel file with the exception population and clear columns, including a few cases we can trace from source to conclusion.

The available evidence is customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories. The analysis can identify recurrence and later behaviour, not customer satisfaction that was never recorded.

Thank you
