Primary-bank behaviour, not account-open counts

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

The board keeps using active accounts as a proxy for customer primacy, and that assumption needs to be challenged. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Could the answer be that customers keep the account open but move useful activity elsewhere? Or are we actually seeing that fee or service friction precedes the drop in activity? I also do not want us to miss the possibility that regular inflows and recurring payments indicate a primary relationship.

We looked at a version of this before. For the February 2020 review, please show what changed and whether the earlier conclusion still holds. The practical decision is how Keystone should define a primary customer and which customers need service recovery rather than marketing. Please send a control view with the exceptions, owner and reason each item was included; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; customer contacts, complaints and suggestions. Use transaction behaviour as a proxy. Do not claim to observe activity held at another bank.

Regards
