A resilience rehearsal using real customer journeys

Hi team,

The resilience plan lists systems, but customers experience end-to-end services that cross ATM, card, transaction and communication processes.

We looked at a version of this before. For the March 2020 review, please show what changed and whether the earlier conclusion still holds. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Can you test these explanations rather than choosing one at the start?

- manual workarounds create later reconciliation breaks
- recovery restores authorisation before posting catches up
- cash access degrades before account servicing

The decision is the order in which critical services should be recovered and tested. Please give us a Power BI page with drill-through to a reproducible case list.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions; debit-order mandates, collection dates, suspensions and cancellations. Treat this as a historical service-impact rehearsal, not proof of infrastructure capacity.

Thanks
