Audit wants the exceptions that became normal

Hi,

This came up in a working session and nobody had the same definition.

Audit is testing whether approvals, declines, restrictions and collections outcomes are consistent with recorded policy inputs.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: overrides are rare and explainable; missing data looks like an override; or a channel or period has a materially different decision pattern.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. We looked at a version of this before. For the March 2020 review, please show what changed and whether the earlier conclusion still holds.

What we need to decide is the sample for process-owner walkthroughs and policy evidence. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; monthly account snapshots, status events, limits, product enrolments and signatories; collections cases, promises to pay and recovery payments; monthly customer and KYC snapshots. The files do not contain every approval authority or policy version; flag unexplained differences rather than declaring misconduct.

Thank you
