Which card declines become complaints?

Team,

Before this becomes another standing report, can we answer the real question?

The same decline code can lead to a successful retry, an ATM attempt, a phone call or lost activity. The possible stories are that most declines recover immediately, that poor explanations drive complaints more than the decline itself, or that repeat declines cluster by card state or channel.

We looked at a version of this before. For the March 2020 review, please show what changed and whether the earlier conclusion still holds. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Please prepare a short decision pack with no more than five slides and an attached evidence table. The output must help us decide which decline reasons need rule, message or service changes.

Data available: transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions.

Please state the limitation plainly: The data does not contain merchant terminal logs or card-scheme dispute outcomes.

Thanks
