Quick question: A funding-stability proxy from the data we actually have

Hi team,

ALM wants a directional view of retail funding stability based on transaction behaviour and account persistence.

We looked at a version of this before. For the March 2020 review, please show what changed and whether the earlier conclusion still holds. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Can you test these explanations rather than choosing one at the start?

- large opening deposits overstate durable funding
- customers with service problems move money out faster
- salary-like and recurring inflows are more stable

The decision is which behavioural assumptions deserve formal modelling when balance and regulatory data become available. Please give us a control view with the exceptions, owner and reason each item was included.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; available initial-deposit records up to the request date; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. There are no daily account balances, wholesale funding positions or regulatory cash-flow buckets, so do not calculate LCR or NSFR.

Thanks
