The participation file needs an operational responsibility map

Hi team,

A loan participation question has exposed confusion about which bank originated, serviced and carried each risk share.

We looked at a version of this before. For the May 2020 review, please show what changed and whether the earlier conclusion still holds. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Can you test these explanations rather than choosing one at the start?

- customer-facing activity is being attributed to the wrong institution
- the records clearly support the operating model
- servicing actions do not align with the stated role

The decision is which cases require document review and which are data-quality corrections. Please give us a Power BI page with drill-through to a reproducible case list.

You should be able to build the evidence from loan participation and servicing records available by the request date; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; debit-order mandates, collection dates, suspensions and cancellations; collections cases, promises to pay and recovery payments. The dataset records roles and activity but is not the signed legal agreement.

Thanks
