Which add-ons are actually used?

Hi,

This came up in a working session and nobody had the same definition.

Product bundles are recorded at account level, but Pricing needs to know whether customers use optional features and remain active.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: default products are mistaken for cross-sell; optional products deepen activity; or some bundles increase service contact without increasing use.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. We looked at a version of this before. For the May 2020 review, please show what changed and whether the earlier conclusion still holds.

What we need to decide is which bundle components should be retained, repriced or removed from campaigns. Please bring a Power BI page with drill-through to a reproducible case list, including a few cases we can trace from source to conclusion.

The available evidence is monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; campaign design and customer responses. Product enrolment is not the same as product usage; define observable use before measuring adoption.

Thank you
