ATM failure is becoming branch workload

Team,

Before this becomes another standing report, can we answer the real question?

ATM failures and blocked-card issues can shift customers toward branches, especially during infrastructure disruption. The possible stories are that customers switch to smaller withdrawals or branch contact, that cash-bin or host issues dominate, or that specific provinces show repeat access failure.

We looked at a version of this before. For the May 2020 review, please show what changed and whether the earlier conclusion still holds. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Please prepare a one-page finding note plus the underlying CSV for our own review. The output must help us decide where contingency communication and ATM support should be prioritised.

Data available: ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; monthly customer and KYC snapshots.

Please state the limitation plainly: The data does not contain branch cash holdings or queue time.

Thanks
