The customer table needs an access design

Hi team,

Teams are asking for customer identity, risk, income and contact fields in broad analytical extracts.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2020 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Can you test these explanations rather than choosing one at the start?

- different projects require different retention and access
- restricted identifiers are being copied for convenience
- most use cases need derived or masked fields

The decision is the shared schema, restricted extension and audit trail. Please give us a one-page finding note plus the underlying CSV for our own review.

You should be able to build the evidence from monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. Minimise access to identity, contact, protected and investigation fields; usefulness alone is not a lawful purpose.

Thanks
