Card blocks need a customer-harm view

Hi,

This came up in a working session and nobody had the same definition.

Card blocking protects customers, but repeated legitimate attempts and later complaints may reveal controls that are too blunt.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: ordinary PIN errors create avoidable blocks; blocked cards follow genuinely unusual sequences; or customers receive inconsistent recovery paths.

Different teams have produced different answers from the same period, so population and timing rules need to be visible. We looked at a version of this before. For the June 2020 review, please show what changed and whether the earlier conclusion still holds.

What we need to decide is where thresholds, escalation or customer communication should change. Please bring a working Excel file with the exception population and clear columns, including a few cases we can trace from source to conclusion.

The available evidence is ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. Do not label a block as incorrect without the rule decision and investigation outcome.

Thank you
