### Which technical failures actually harmed customers?

---

Hi,

This came up in a working session and nobody had the same definition.

Infrastructure can see technical symptoms, but incident severity should reflect failed customer journeys and repeat attempts rather than machine alerts alone.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: latency rises before visible failure; a small terminal or channel group creates most harm; or customers retry across channels and create duplicates.

There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases. We looked at a version of this before. For the June 2020 review, please show what changed and whether the earlier conclusion still holds.

What we need to decide is incident priority, root-cause ownership and the customer-remediation population. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. The dataset has channel and ATM telemetry, not complete application, server or network logs.

Thank you
