Reperform one risk number end to end

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Management reports are expanding faster than the evidence showing how each number was sourced, transformed and approved. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Could the answer be that different teams use the same label for different populations? Or are we actually seeing that the number can be reperformed from source? I also do not want us to miss the possibility that manual exclusions are changing the answer.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2020 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which data controls must be formalised before the next assurance review. Please send a one-page finding note plus the underlying CSV for our own review; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; customer contacts, complaints and suggestions. Do not create a full enterprise lineage claim; reperform a defined metric and document every limitation.

Regards
