Quick question: ageing operational exceptions by customer harm

Morning,

I need help with something that sounds simple but probably is not.

Operations needs an ageing view that prioritises unresolved customer impact rather than raw exception count. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

The questions I would ask in the room are:

1. What would we expect to see if small-value cases remain open because ownership is unclear?
2. What evidence would instead support that status updates close records without resolving the transaction?
3. How do we rule out that older cases cluster in one process?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2020 as the new evidence point rather than recycling the earlier conclusion. Please work towards the exception priority rule and escalation threshold. A useful output would be a working Excel file with the exception population and clear columns.

Use transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; collections cases, promises to pay and recovery payments; monthly account snapshots, status events, limits, product enrolments and signatories. One caution: Use observable dates and outcomes; do not infer internal queue age where no queue record exists.

Regards
