Reissue, activation and first-use journey

Morning,

I need help with something that sounds simple but probably is not.

Card Operations needs to know whether replacement cards become usable quickly and whether old-card attempts continue after reissue. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

The questions I would ask in the room are:

1. What would we expect to see if customers resume normal use quickly?
2. What evidence would instead support that old credentials continue to generate declines?
3. How do we rule out that ATM and transaction channels reflect card history differently?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2020 as the new evidence point rather than recycling the earlier conclusion. Please work towards which reissue controls or customer messages need improvement. A useful output would be a Power BI page with drill-through to a reproducible case list.

Use monthly account snapshots, status events, limits, product enrolments and signatories; ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions. One caution: Card numbers are historical lists in the account snapshot; use issue and expiry dates to determine the active card.

Regards
