The loan return needs a population bridge

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Risk, Lending and Reporting are counting applications, approvals, booked loans and distressed accounts from different starting populations. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Could the answer be that booked loans are missing from downstream repayment views? Or are we actually seeing that declined and withdrawn cases are mixed? I also do not want us to miss the possibility that workflow timing explains most differences.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2020 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the canonical population and exception rules for the next return. Please send a one-page finding note plus the underlying CSV for our own review; I need the exceptions and counter-examples, not only an average.

Work from the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments; debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context. Do not present this as an official regulatory return without the required regulatory taxonomy and sign-off.

Regards
