Quick question: the active-account number may be flattering us

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

The board keeps using active accounts as a proxy for customer primacy, and that assumption needs to be challenged. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

Could the answer be that regular inflows and recurring payments indicate a primary relationship? Or are we actually seeing that customers keep the account open but move useful activity elsewhere? I also do not want us to miss the possibility that fee or service friction precedes the drop in activity.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2020 as the new evidence point rather than recycling the earlier conclusion. The practical decision is how Keystone should define a primary customer and which customers need service recovery rather than marketing. Please send a Power BI page with drill-through to a reproducible case list; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; customer contacts, complaints and suggestions. Use transaction behaviour as a proxy. Do not claim to observe activity held at another bank.

Regards
