Participation cash flows are not following the simple story

Hi team,

Treasury and Lending need to understand whether originated, serviced and participated loans behave differently after booking.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2020 as the new evidence point rather than recycling the earlier conclusion. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Can you test these explanations rather than choosing one at the start?

- risk share and customer behaviour are being confused
- participated loans have different payment timing
- servicing-bank arrangements create operational exceptions

The decision is whether participation terms, servicing controls or reporting need to change. Please give us a control view with the exceptions, owner and reason each item was included.

You should be able to build the evidence from loan participation and servicing records available by the request date; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; collections cases, promises to pay and recovery payments. The files support servicing and behavioural analysis, not external-bank accounting or legal settlement confirmation.

Thanks
