Conversion is not the same as campaign impact

Team,

Before this becomes another standing report, can we answer the real question?

Analytics has been asked to report campaign success, but selected customers may already have been more likely to convert. The possible stories are that the campaign creates incremental response, that service problems suppress otherwise suitable offers, or that targeting explains the apparent lift.

We looked at a version of this before. For the October 2020 review, please show what changed and whether the earlier conclusion still holds. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Please prepare a control view with the exceptions, owner and reason each item was included. The output must help us decide the treatment, control, success window and guardrail measures before the next campaign launches.

Data available: campaign design and customer responses; monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions.

Please state the limitation plainly: Historical campaign responses alone do not identify causal impact where no comparable control group exists.

Thanks
