Quick question: the avoidable-work question for EXCO

Hi team,

Digital use is rising, but repeat calls, branch visits and failed journeys may mean the bank is serving the same need more than once.

We looked at a version of this before. For the October 2020 review, please show what changed and whether the earlier conclusion still holds. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Can you test these explanations rather than choosing one at the start?

- a small set of broken journeys creates most repeat contact
- digital journeys are resolving customer needs
- customers begin digitally and finish through an assisted channel

The decision is which journeys should be fixed before another channel-adoption campaign is funded. Please give us a one-page finding note plus the underlying CSV for our own review.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. The dataset can measure repeat contacts and channel sequences, not fully allocated service cost.

Thanks
