Decline reason versus customer outcome

Hi team,

The same decline code can lead to a successful retry, an ATM attempt, a phone call or lost activity.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2020 as the new evidence point rather than recycling the earlier conclusion. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Can you test these explanations rather than choosing one at the start?

- repeat declines cluster by card state or channel
- most declines recover immediately
- poor explanations drive complaints more than the decline itself

The decision is which decline reasons need rule, message or service changes. Please give us a short decision pack with no more than five slides and an attached evidence table.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. The data does not contain merchant terminal logs or card-scheme dispute outcomes.

Thanks
