The bank should not confuse low income with low value

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Compliance needs an outcome view for customers who may be more exposed to failed payments, repeated fees or difficult service journeys. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Could the answer be that income and collections stress identify higher exposure? Or are we actually seeing that channel access affects resolution? I also do not want us to miss the possibility that standard contact strategies create repeat complaints.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2020 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which customer-treatment controls and monitoring indicators should be introduced. Please send a working Excel file with the exception population and clear columns; I need the exceptions and counter-examples, not only an average.

Work from monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context; collections cases, promises to pay and recovery payments; customer contacts, complaints and suggestions. Use vulnerability indicators carefully and never use them to reduce service or exclude customers.

Regards
