The customer statement and transaction view disagree

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

A small number of fee and interest items appear difficult to trace from the transaction record to the customer-facing statement. The discussion is currently being driven by anecdotes, and the teams involved are describing the same customers differently.

Could the answer be that the issue is statement timing? Or are we actually seeing that reversals are not inheriting the original reference cleanly? I also do not want us to miss the possibility that the product configuration and transaction description disagree.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use December 2020 as the new evidence point rather than recycling the earlier conclusion. The practical decision is whether Finance needs a mapping correction, a posting control or a customer remediation list. Please send a model-ready table, data dictionary and an honest baseline; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; monthly account snapshots, status events, limits, product enrolments and signatories; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; customer contacts, complaints and suggestions. Do not calculate general-ledger balances; no general ledger is present.

Regards
