Origination, servicing and risk ownership are being conflated

Team,

Before this becomes another standing report, can we answer the real question?

A loan participation question has exposed confusion about which bank originated, serviced and carried each risk share. The possible stories are that the records clearly support the operating model, that servicing actions do not align with the stated role, or that customer-facing activity is being attributed to the wrong institution.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use January 2021 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

Please prepare a Power BI page with drill-through to a reproducible case list. The output must help us decide which cases require document review and which are data-quality corrections.

Data available: loan participation and servicing records available by the request date; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; debit-order mandates, collection dates, suspensions and cancellations; collections cases, promises to pay and recovery payments.

Please state the limitation plainly: The dataset records roles and activity but is not the signed legal agreement.

Thanks
