Follow-up: two source files tell different stories about the same event

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

A requested analysis changes depending on whether the team starts from transaction, debit-order, account-status or customer-contact records. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Could the answer be that one source is updated retrospectively? Or are we actually seeing that matching logic is joining unrelated records? I also do not want us to miss the possibility that the sources record different stages of one event.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use January 2021 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the source precedence rule and the cases that must remain explicitly unresolved. Please send a Power BI page with drill-through to a reproducible case list; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. Do not force agreement by dropping exceptions; preserve contradictory evidence for owner review.

Regards
