A failed debit may be a calendar problem

Hi team,

Payments wants to test whether collection timing, rather than inability to pay, explains repeat debit-order failure.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2021 as the new evidence point rather than recycling the earlier conclusion. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Can you test these explanations rather than choosing one at the start?

- collection before regular inflow drives failure
- fixed collection rules work differently across customer groups
- retry timing improves success

The decision is whether to test alternative debit dates or change retry logic. Please give us a working Excel file with the exception population and clear columns.

You should be able to build the evidence from debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments. Regular inflows are inferred from transaction patterns; no verified payroll calendar is available.

Thanks
