Quick question: recovery payments need a proper bridge

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Collections and Finance are using different notions of a successful recovery, especially when payments arrive after the promised date or through another channel. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Could the answer be that a payment reaches the account but not the collections case? Or are we actually seeing that late payments are being treated as broken promises? I also do not want us to miss the possibility that partial cures are being reported as full cures.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use February 2021 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the definition of cure and the exception queue that Finance and Collections will both use. Please send a short decision pack with no more than five slides and an attached evidence table; I need the exceptions and counter-examples, not only an average.

Work from collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. The data can reconcile customer and case activity, but not the accounting ledger entry.

Regards
