Follow-up: which exceptions quietly become old?

Hi team,

Operations needs an ageing view that prioritises unresolved customer impact rather than raw exception count.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use March 2021 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Can you test these explanations rather than choosing one at the start?

- status updates close records without resolving the transaction
- older cases cluster in one process
- small-value cases remain open because ownership is unclear

The decision is the exception priority rule and escalation threshold. Please give us a short decision pack with no more than five slides and an attached evidence table.

You should be able to build the evidence from transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; collections cases, promises to pay and recovery payments; monthly account snapshots, status events, limits, product enrolments and signatories. Use observable dates and outcomes; do not infer internal queue age where no queue record exists.

Thanks
