Follow-up: which source change silently changed the business answer?

Hi,

This came up in a working session and nobody had the same definition.

Data Engineering sees changing schemas and needs to distinguish safe expansion from business-definition drift.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: new fields are additive; null patterns reveal a source rollout rather than missing customer data; or renamed or recoded fields break history.

The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. Different teams have produced different answers from the same period, so population and timing rules need to be visible. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use April 2021 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the data contract, quarantine rule and backfill requirement. Please bring a Power BI page with drill-through to a reproducible case list, including a few cases we can trace from source to conclusion.

The available evidence is monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields. A technical schema match does not prove semantic consistency; business owners must confirm meaning.

Thank you
