Follow-up: did the retry cure the payment or duplicate it?

Team,

Before this becomes another standing report, can we answer the real question?

Payment attempts, reversals and late postings can create apparent duplicates or genuine duplicate customer impact. The possible stories are that some customers were debited more than once before reversal, that late settlement creates false duplicates, or that retries are correctly linked.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2021 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Please prepare a short decision pack with no more than five slides and an attached evidence table. The output must help us decide the matching rule, customer-impact list and preventive control.

Data available: transaction-level timestamps, channels, amounts, statuses and error context; debit-order mandates, collection dates, suspensions and cancellations; customer contacts, complaints and suggestions.

Please state the limitation plainly: Statement evidence is available only for selected accounts; use transaction identifiers and timing for the full population.

Thanks
