The queue may begin outside the branch

Hi,

This came up in a working session and nobody had the same definition.

Regional managers suspect that statement requests, card problems and failed digital journeys are creating avoidable branch demand.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: service failures drive repeat visits; customers prefer branch for complex needs; or specific communications fail to explain the next step.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. Different teams have produced different answers from the same period, so population and timing rules need to be visible. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2021 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is which demand should be removed, redirected or staffed differently. Please bring a one-page finding note plus the underlying CSV for our own review, including a few cases we can trace from source to conclusion.

The available evidence is customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. There is no branch queue-time or staff-roster table; infer demand drivers, not staffing productivity.

Thank you
