Digital volume is not the same as lower cost

Morning,

I need help with something that sounds simple but probably is not.

Digital use is rising, but repeat calls, branch visits and failed journeys may mean the bank is serving the same need more than once. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

The questions I would ask in the room are:

1. What would we expect to see if digital journeys are resolving customer needs?
2. What evidence would instead support that a small set of broken journeys creates most repeat contact?
3. How do we rule out that customers begin digitally and finish through an assisted channel?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use May 2021 as the new evidence point rather than recycling the earlier conclusion. Please work towards which journeys should be fixed before another channel-adoption campaign is funded. A useful output would be a model-ready table, data dictionary and an honest baseline.

Use transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; ATM attempts, host responses, PIN attempts, blocked-card state and latency; monthly account snapshots, status events, limits, product enrolments and signatories. One caution: The dataset can measure repeat contacts and channel sequences, not fully allocated service cost.

Regards
