Follow-up: why did the customer have to ask twice?

Team,

Before this becomes another standing report, can we answer the real question?

Customer Experience wants to understand which issues return within days and whether the customer changes channel to get an answer. The possible stories are that channel handover loses context, that the first contact did not resolve the issue, or that transaction posting changed after the first answer.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use June 2021 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

Please prepare a Power BI page with drill-through to a reproducible case list. The output must help us decide which journeys need process redesign, clearer wording or ownership.

Data available: customer contacts, complaints and suggestions; transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; debit-order mandates, collection dates, suspensions and cancellations.

Please state the limitation plainly: Communication records do not contain every call recording or agent action, so measure observable repeat contact.

Thanks
