Follow-up: vendor performance without a vendor master

Morning,

I need help with something that sounds simple but probably is not.

Third-Party Risk wants to understand whether external dependencies are repeatedly associated with failed or delayed customer journeys. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. Different teams have produced different answers from the same period, so population and timing rules need to be visible.

The questions I would ask in the room are:

1. What would we expect to see if third-party timeouts cluster by channel?
2. What evidence would instead support that internal latency is being attributed externally?
3. How do we rule out that repeat incidents create disproportionate customer contact?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2021 as the new evidence point rather than recycling the earlier conclusion. Please work towards which supplier relationship requires evidence gathering or a formal service review. A useful output would be a short decision pack with no more than five slides and an attached evidence table.

Use transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency; customer contacts, complaints and suggestions. One caution: There is no vendor master, contract, SLA or invoice table. Treat external-context fields as indicators, not contractual proof.

Regards
