Quick question: the same symptom can belong to Cyber or Operations

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Timeouts, host-response failures and repeated attempts can resemble malicious activity or ordinary service degradation. The timing also overlaps with Civil unrest and logistics disruption in KZN and Gauteng. Treat that as context to test, not an answer. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

Could the answer be that operational retries are obscuring the original event? Or are we actually seeing that a concentrated account or terminal pattern suggests abuse? I also do not want us to miss the possibility that technical failure explains the cluster.

We looked at a version of this before. For the July 2021 review, please show what changed and whether the earlier conclusion still holds. The practical decision is the minimum evidence needed to route an alert to Cyber, Fraud, Payments or Infrastructure. Please send a Power BI page with drill-through to a reproducible case list; I need the exceptions and counter-examples, not only an average.

Work from transaction-level timestamps, channels, amounts, statuses and error context; ATM attempts, host responses, PIN attempts, blocked-card state and latency. This is triage design from available telemetry, not a substitute for SOC, firewall or application logs.

Regards
