Follow-up: are our standard processes producing worse outcomes for vulnerable customers?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Compliance needs an outcome view for customers who may be more exposed to failed payments, repeated fees or difficult service journeys. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

Could the answer be that channel access affects resolution? Or are we actually seeing that standard contact strategies create repeat complaints? I also do not want us to miss the possibility that income and collections stress identify higher exposure.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2021 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which customer-treatment controls and monitoring indicators should be introduced. Please send a working Excel file with the exception population and clear columns; I need the exceptions and counter-examples, not only an average.

Work from monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context; collections cases, promises to pay and recovery payments; customer contacts, complaints and suggestions. Use vulnerability indicators carefully and never use them to reduce service or exclude customers.

Regards
