Follow-up: which promises are realistic at the moment they are made?

Hi,

This came up in a working session and nobody had the same definition.

Collectors record promises with different amounts and dates, and management needs a fair measure of promise quality.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: affordable promises are kept more often; partial payments are being treated inconsistently; or channel and timing affect outcomes.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use July 2021 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is the promise definition, coaching view and model target. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; customer contacts, complaints and suggestions. Do not rank individual collectors without workload, assignment and contact-attempt history.

Thank you
