Follow-up: where does cash access fail when customers need it most?

Hi,

This came up in a working session and nobody had the same definition.

ATM failures and blocked-card issues can shift customers toward branches, especially during infrastructure disruption.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: customers switch to smaller withdrawals or branch contact; cash-bin or host issues dominate; or specific provinces show repeat access failure.

Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use August 2021 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is where contingency communication and ATM support should be prioritised. Please bring a model-ready table, data dictionary and an honest baseline, including a few cases we can trace from source to conclusion.

The available evidence is ATM attempts, host responses, PIN attempts, blocked-card state and latency; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; monthly customer and KYC snapshots. The data does not contain branch cash holdings or queue time.

Thank you
