Quick question: fairness review: risk signal or missing-data signal?

Hi team,

Model Risk is concerned that channel, document availability and data completeness may become proxies for customer groups rather than genuine risk.

We looked at a version of this before. For the August 2021 review, please show what changed and whether the earlier conclusion still holds. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure.

Can you test these explanations rather than choosing one at the start?

- branch and digital populations differ before modelling
- missing documents drive predictions
- performance gaps disappear after controlling for product and income

The decision is which features need restriction, monitoring or clearer business justification. Please give us a Power BI page with drill-through to a reproducible case list.

You should be able to build the evidence from monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments. Protected-attribute analysis must be governed and access-controlled; do not use ethnicity or gender for targeting or adverse treatment.

Thanks
