Follow-up: are we collecting on the wrong day for the customer's cash flow?

Hi,

This came up in a working session and nobody had the same definition.

Payments wants to test whether collection timing, rather than inability to pay, explains repeat debit-order failure.

I do not want a dashboard that simply counts the outcome. Start with the competing explanations: collection before regular inflow drives failure; fixed collection rules work differently across customer groups; or retry timing improves success.

The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. This has returned because the previous answer was useful but not strong enough to become a standing rule. Use September 2021 as the new evidence point rather than recycling the earlier conclusion.

What we need to decide is whether to test alternative debit dates or change retry logic. Please bring a control view with the exceptions, owner and reason each item was included, including a few cases we can trace from source to conclusion.

The available evidence is debit-order mandates, collection dates, suspensions and cancellations; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields; collections cases, promises to pay and recovery payments. Regular inflows are inferred from transaction patterns; no verified payroll calendar is available.

Thank you
