Follow-up: who pays without a call?

Team,

Before this becomes another standing report, can we answer the real question?

Collections wants to reduce unnecessary contact by identifying customers who usually restore the account without intervention. The possible stories are that balance recovery and payment timing identify self-cure, that repeat NSF customers need a different treatment, or that past contact creates the apparent cure.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2021 as the new evidence point rather than recycling the earlier conclusion. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Please prepare a Power BI page with drill-through to a reproducible case list. The output must help us decide which accounts can receive a light-touch reminder and which need an agent.

Data available: collections cases, promises to pay and recovery payments; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; debit-order mandates, collection dates, suspensions and cancellations.

Please state the limitation plainly: Observed cure after contact is not proof that the contact caused it.

Thanks
