Follow-up: useful does not mean everyone should see it

Morning,

I need help with something that sounds simple but probably is not.

Teams are asking for customer identity, risk, income and contact fields in broad analytical extracts. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. The first extracts did not reconcile, which means source precedence and exclusions must be part of the answer.

The questions I would ask in the room are:

1. What would we expect to see if most use cases need derived or masked fields?
2. What evidence would instead support that restricted identifiers are being copied for convenience?
3. How do we rule out that different projects require different retention and access?

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2021 as the new evidence point rather than recycling the earlier conclusion. Please work towards the shared schema, restricted extension and audit trail. A useful output would be a working Excel file with the exception population and clear columns.

Use monthly customer and KYC snapshots; monthly account snapshots, status events, limits, product enrolments and signatories; customer contacts, complaints and suggestions. One caution: Minimise access to identity, contact, protected and investigation fields; usefulness alone is not a lawful purpose.

Regards
