Follow-up: do bundled products deepen relationships or just decorate accounts?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Product bundles are recorded at account level, but Pricing needs to know whether customers use optional features and remain active. The operating teams agree that more journeys are failing; they disagree on whether the customer, the bank or a downstream party owns the failure. There are enough data exceptions to make a polished average dangerous; preserve the unresolved cases.

Could the answer be that default products are mistaken for cross-sell? Or are we actually seeing that optional products deepen activity? I also do not want us to miss the possibility that some bundles increase service contact without increasing use.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use October 2021 as the new evidence point rather than recycling the earlier conclusion. The practical decision is which bundle components should be retained, repriced or removed from campaigns. Please send a Power BI page with drill-through to a reproducible case list; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; transaction-level timestamps, channels, amounts, statuses and error context; customer contacts, complaints and suggestions; campaign design and customer responses. Product enrolment is not the same as product usage; define observable use before measuring adoption.

Regards
