Follow-up: before we publish, who owns this denominator?

Hi all,

I may be joining dots that do not belong together, so please challenge the premise.

Analytics is receiving requests that use the same business term for different populations, dates and customer relationships. Several teams are reporting more failed or retried activity than they expected, but they do not agree on the cause.

Could the answer be that snapshot timing creates the difference? Or are we actually seeing that an undocumented exclusion is changing the denominator? I also do not want us to miss the possibility that the teams need different metrics.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2021 as the new evidence point rather than recycling the earlier conclusion. The practical decision is the governed definition, owner, exclusions and reconciliation bridge. Please send a Power BI page with drill-through to a reproducible case list; I need the exceptions and counter-examples, not only an average.

Work from monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context. A technically consistent definition still needs business ownership and approval.

Regards
