Follow-up: schema drift is becoming a reporting risk

Team,

Before this becomes another standing report, can we answer the real question?

Data Engineering sees changing schemas and needs to distinguish safe expansion from business-definition drift. The possible stories are that new fields are additive, that renamed or recoded fields break history, or that null patterns reveal a source rollout rather than missing customer data.

This has returned because the previous answer was useful but not strong enough to become a standing rule. Use November 2021 as the new evidence point rather than recycling the earlier conclusion. Failure anecdotes are beginning to drive decisions, although retries and late posting may be making the problem look larger than the affected-customer population.

Please prepare a working Excel file with the exception population and clear columns. The output must help us decide the data contract, quarantine rule and backfill requirement.

Data available: monthly account snapshots, status events, limits, product enrolments and signatories; monthly customer and KYC snapshots; transaction-level timestamps, channels, amounts, statuses and error context; the latest closed loan files available by the request date, including affordability, pricing and origination risk fields.

Please state the limitation plainly: A technical schema match does not prove semantic consistency; business owners must confirm meaning.

Thanks
